

ABSTRACT OF THE DISCLOSURE

Provided are a voice command processing system and method. A voice command processing method includes constructing a plurality of databases, in which voice commands including an operation name are stored, receiving a voice command to separate the received voice command into an operation name and an object name, finding a database corresponding to the operation name within the plurality of databases, and finding the object name in the found database. According to the voice command processing system and method, time required to access a database corresponding to a voice command input by the user can be reduced.
